

## ATF-180

Panel Inverter

SUITABLE FOR PANELS UP TO 60" BY 144"

The panel serves as transfer/inverter module in a sanding or a finishing line or in an integrated production line. The Panel Inverter is designed for flipping single panels or batches of panels up side down, with an optional pause at 80° for quality inspection.

Panels received in a horizontal plane. A first set of arms raises them to the 80° position, while a second set of arms meets the other surface of the panel in a scissors like fashion. After passing the 90° point together with the panel, the first set of arms retracts to its receiving position. The second set of arms places the panel on the opposite side of the inverter. Depending on the weight of the load needing to be inverted, the Inverter can be hydraulically or pneumatically activated.

Custom dimension units are available upon request.
